

Metator nevadensis

Metator nevadensis, a grasshopper of the Great Basin Region, was found in limited numbers in Sublette County during this survey. They were collected in areas with shrubs or sagebrush. Adults were collected in late August to early September. Its feeding habits are not known in Wyoming. The related *M. pardalinus* is a grass feeder, but *M. nevadensis* has never been numerous enough in Wyoming to cause damage to rangelands.
