Printer Configuration

A default printer must be installed in Windows before the program will open. This must be done even when a printer **is not** physically attached to the computer.

Up to three printers can be used with a switch box, a network, or USB connections. This allows the use of one printer with regular paper, a second printer with item tag paper, and a third printer with check blanks. The three printers must be identical when using the switch box. Three different printers can be used with USB ports.

Print the instructions by clicking **Go to > Printer Configuration > Instructions.** Most counties use one printer and can leave the printer configuration at the single printer default. Please review the setup instructions included with the program when using three printers.
