Printer Configuration

A default printer must be installed in Windows before the program will open. This must be done even when a printer is not physically attached to the computer.

Up to three printers can be used with a switch box, a network, or USB connections. This allows the use of one printer with regular paper, a second printer with item tag paper, and a third printer with check blanks. The three printers must be identical when using the switch box. Three different printers can be used with USB ports.

Print the instructions by clicking Go to > Printer Configuration > Instructions. Most counties use one printer and can leave the printer configuration at the single printer default. Please review the setup instructions included with the program when using three printers.
