

# Diet Quality of Sagebrush

Diet Selection, Habitat  
Selection, and Influences of  
Restoration Practices

Jennifer S. Forbey and Marcella R. Fremgen, Boise State University  
John W. Connelly, Idaho Fish and Game, retired  
March 25, 2015

# Wild Herbivores Forage Selectively

# Closer to Home: pygmy rabbits are selective

**Unbrowsed**

**Browsed**

# Why do herbivores forage selectively?

1. Acquire protein/nutrients
2. Avoid toxin consumption

# Why do animals select for protein?

Many positive effects on energetically expensive activities:

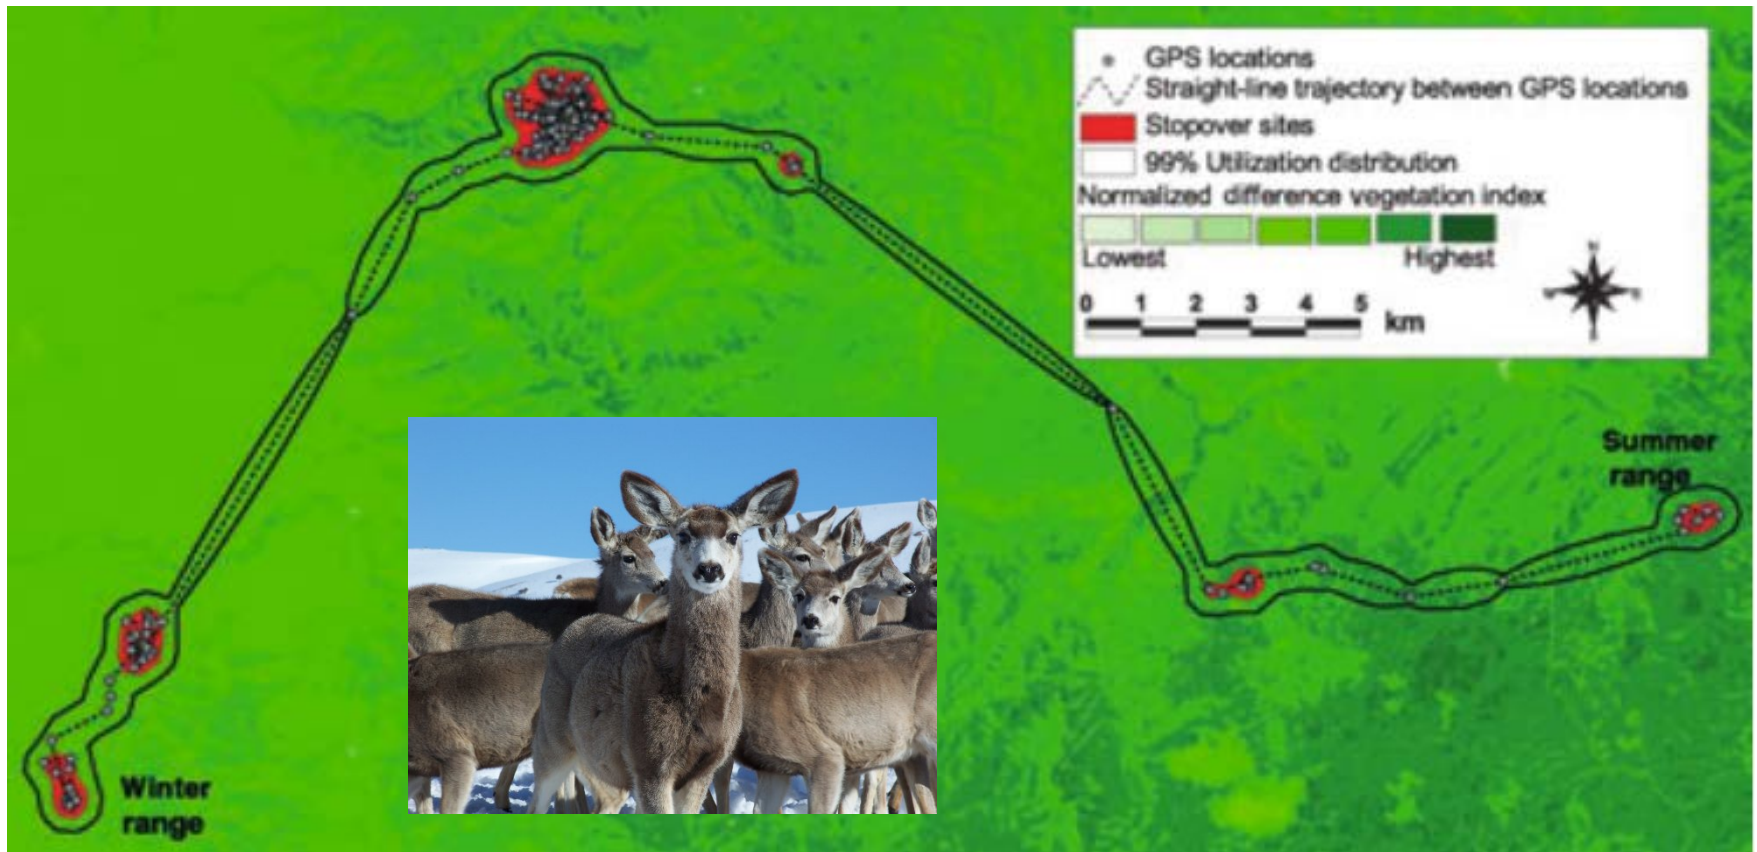

- Maintain body condition
- Growth
- Movement
- Reproduction

# Protein influences habitat use by pygmy rabbits

# Protein Impacts Movement

- Variation in forage quality drives animal movements
- Migratory species most commonly studied

# Diet Quality Impacts Reproduction

## Brushtail possum

- Reproductive success is up to 5 times higher for individuals consuming high quality diets

Photo by J.J. Harrison

# Plants are not an easy source to acquire protein from...

- Co-evolutionary arms race between plants and herbivores
- Plants physically and/or chemically defended

# Why do animals avoid toxins?

## Many negative effects:

- Bitter taste
- Nausea
- Oxidative stress (leads to cell death)
- Inhibit digestive enzymes
- Energetically expensive to metabolize

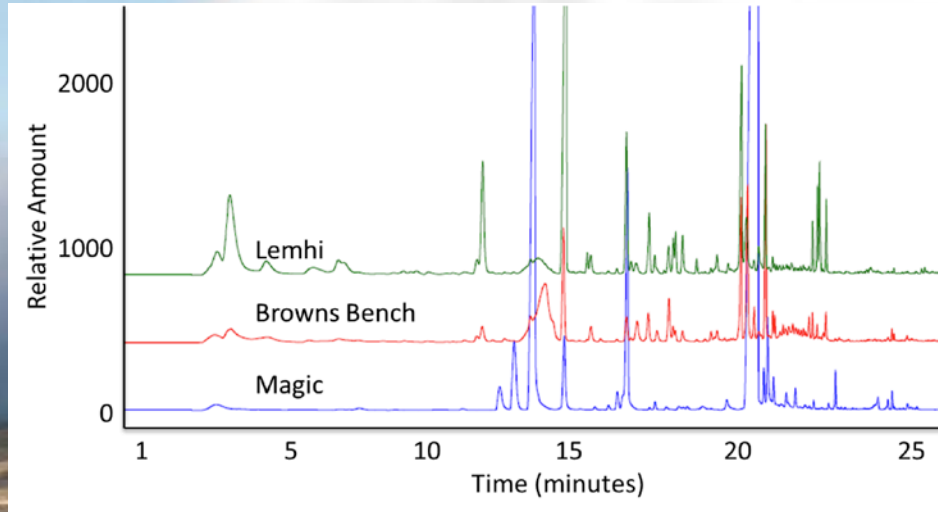

Therefore, toxins regulate behavior...

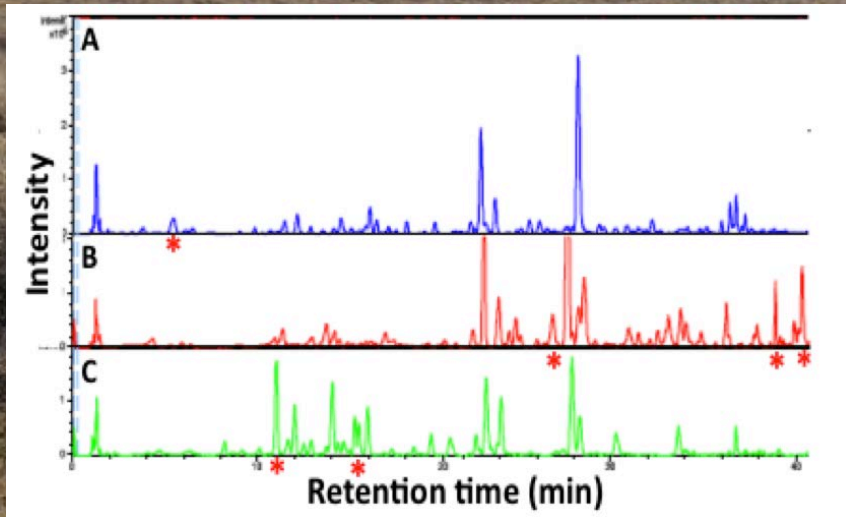

Selective foraging is an adaptation to avoid toxins in diets

# Diverse chemicals in sagebrush are TOXIC!

30+ volatile compounds (monoterpenes)

75+ polyphenols (include coumarins)

35+ sesquiterpene lactones

# Monoterpene Content in Sagebrush

# Phenolics (polyphenols)

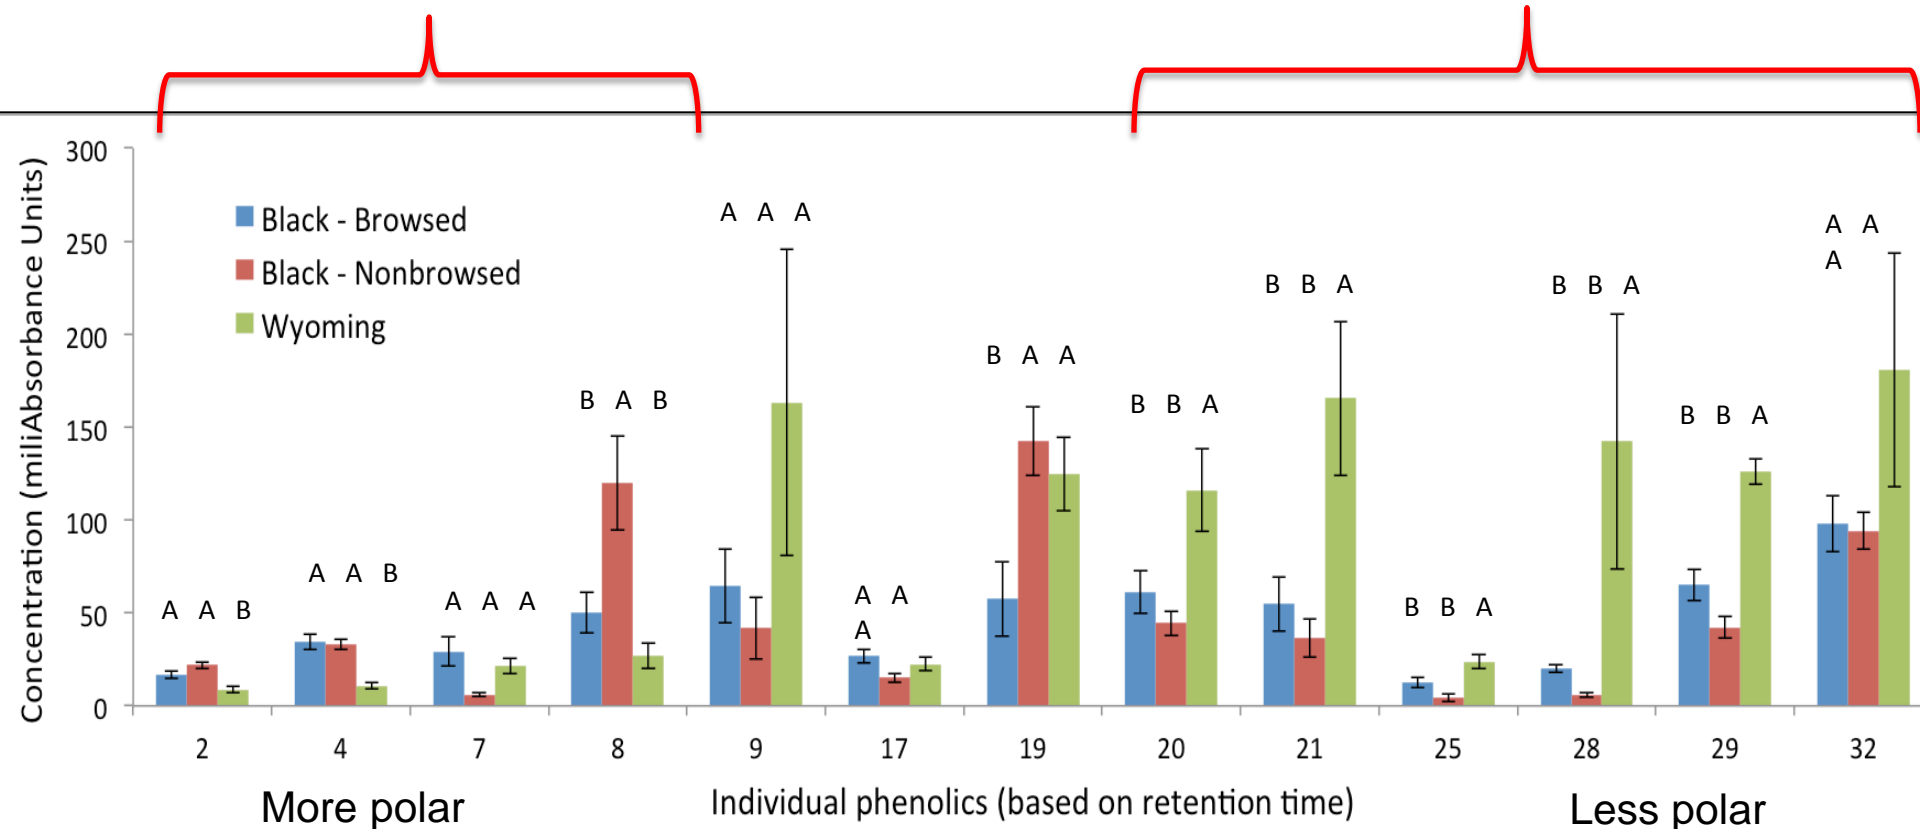

Include coumarins

Polar phenolics

Black > Wyoming

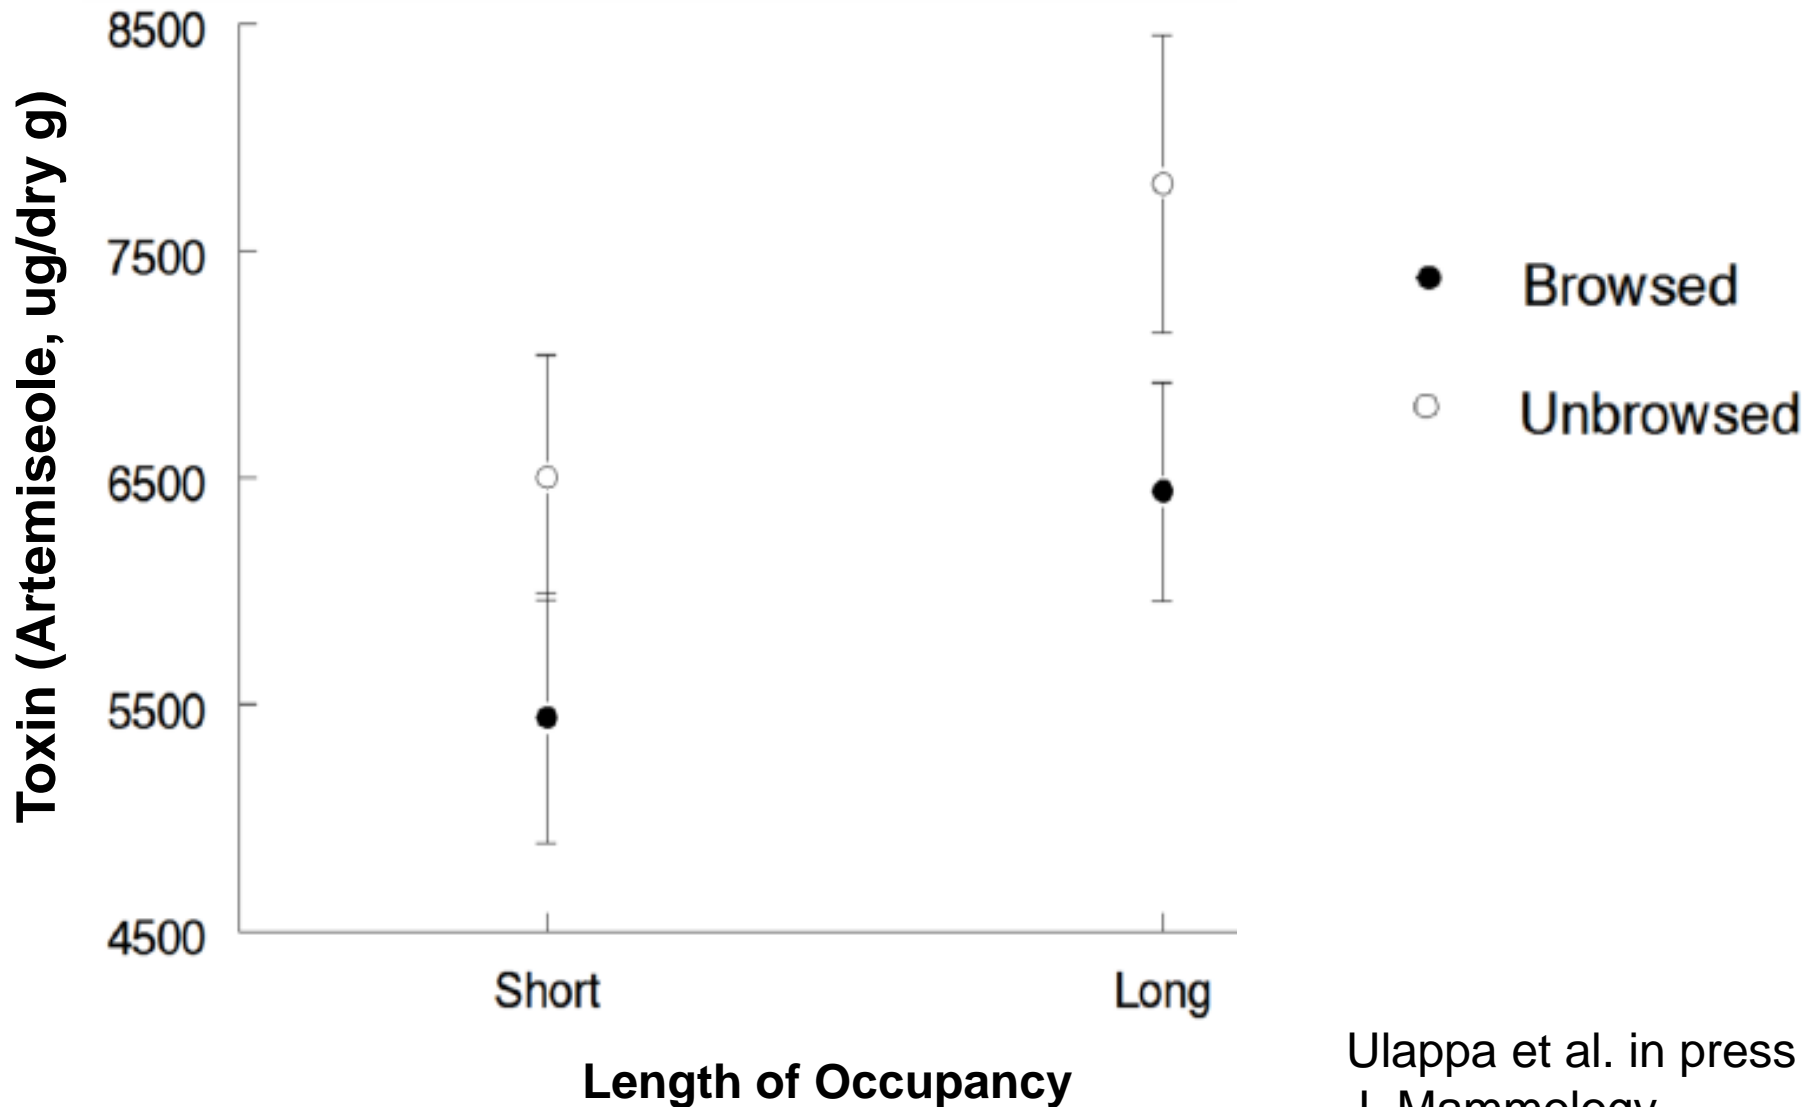

Less polar phenolics

Wyoming > Black

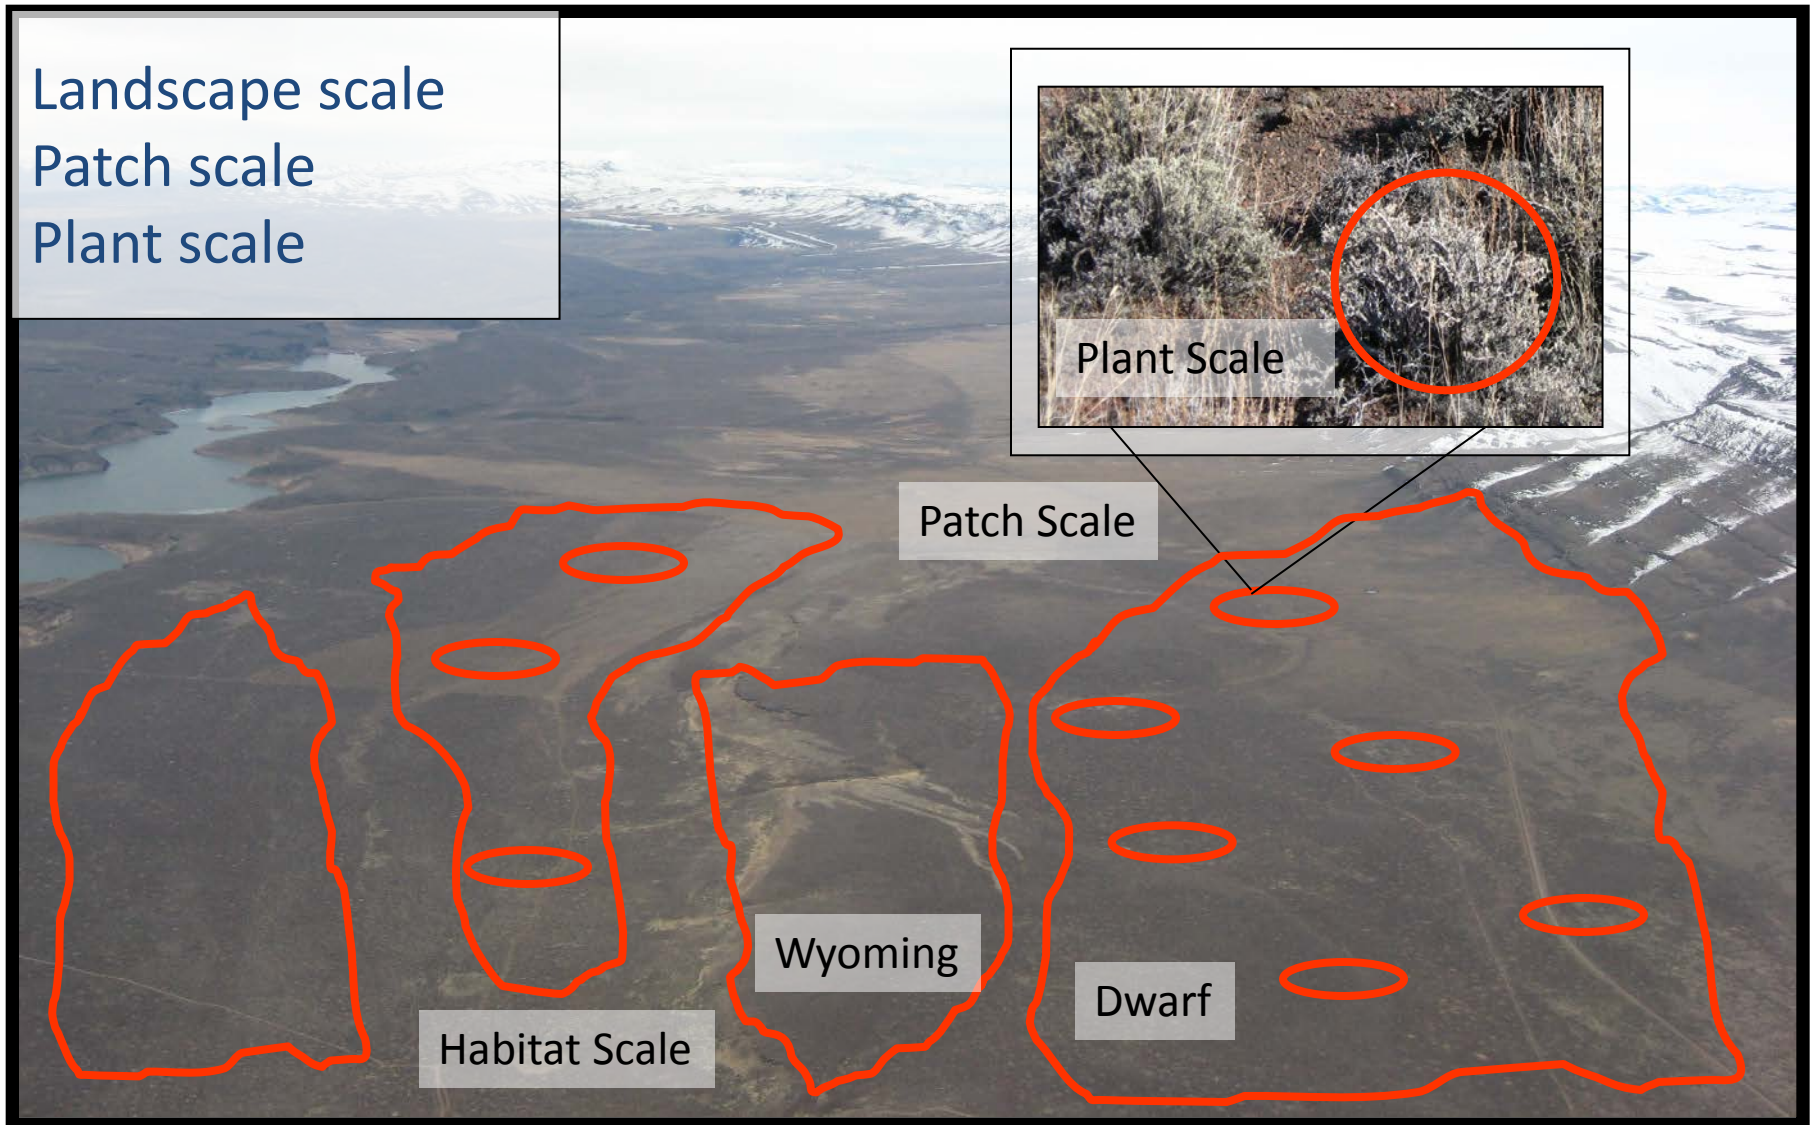

# Toxins limit habitat use by pygmy rabbits

# Sage-grouse avoid toxins at multiple spatial scales

Landscape scale  
Patch scale

Habitat Scale

# Habitat Scale: Sage-grouse selected habitats with black sagebrush

| Habitat                | Used      | Random    |
|------------------------|-----------|-----------|
| Wyoming Sagebrush      | 1         | 19        |
| <b>Black sagebrush</b> | <b>54</b> | 36        |
| <b>Total</b>           | <b>55</b> | <b>55</b> |

Fisher's exact test,  $P < 0.0001$ , odds ratio = 27.8

Habitat Scale

Wyoming

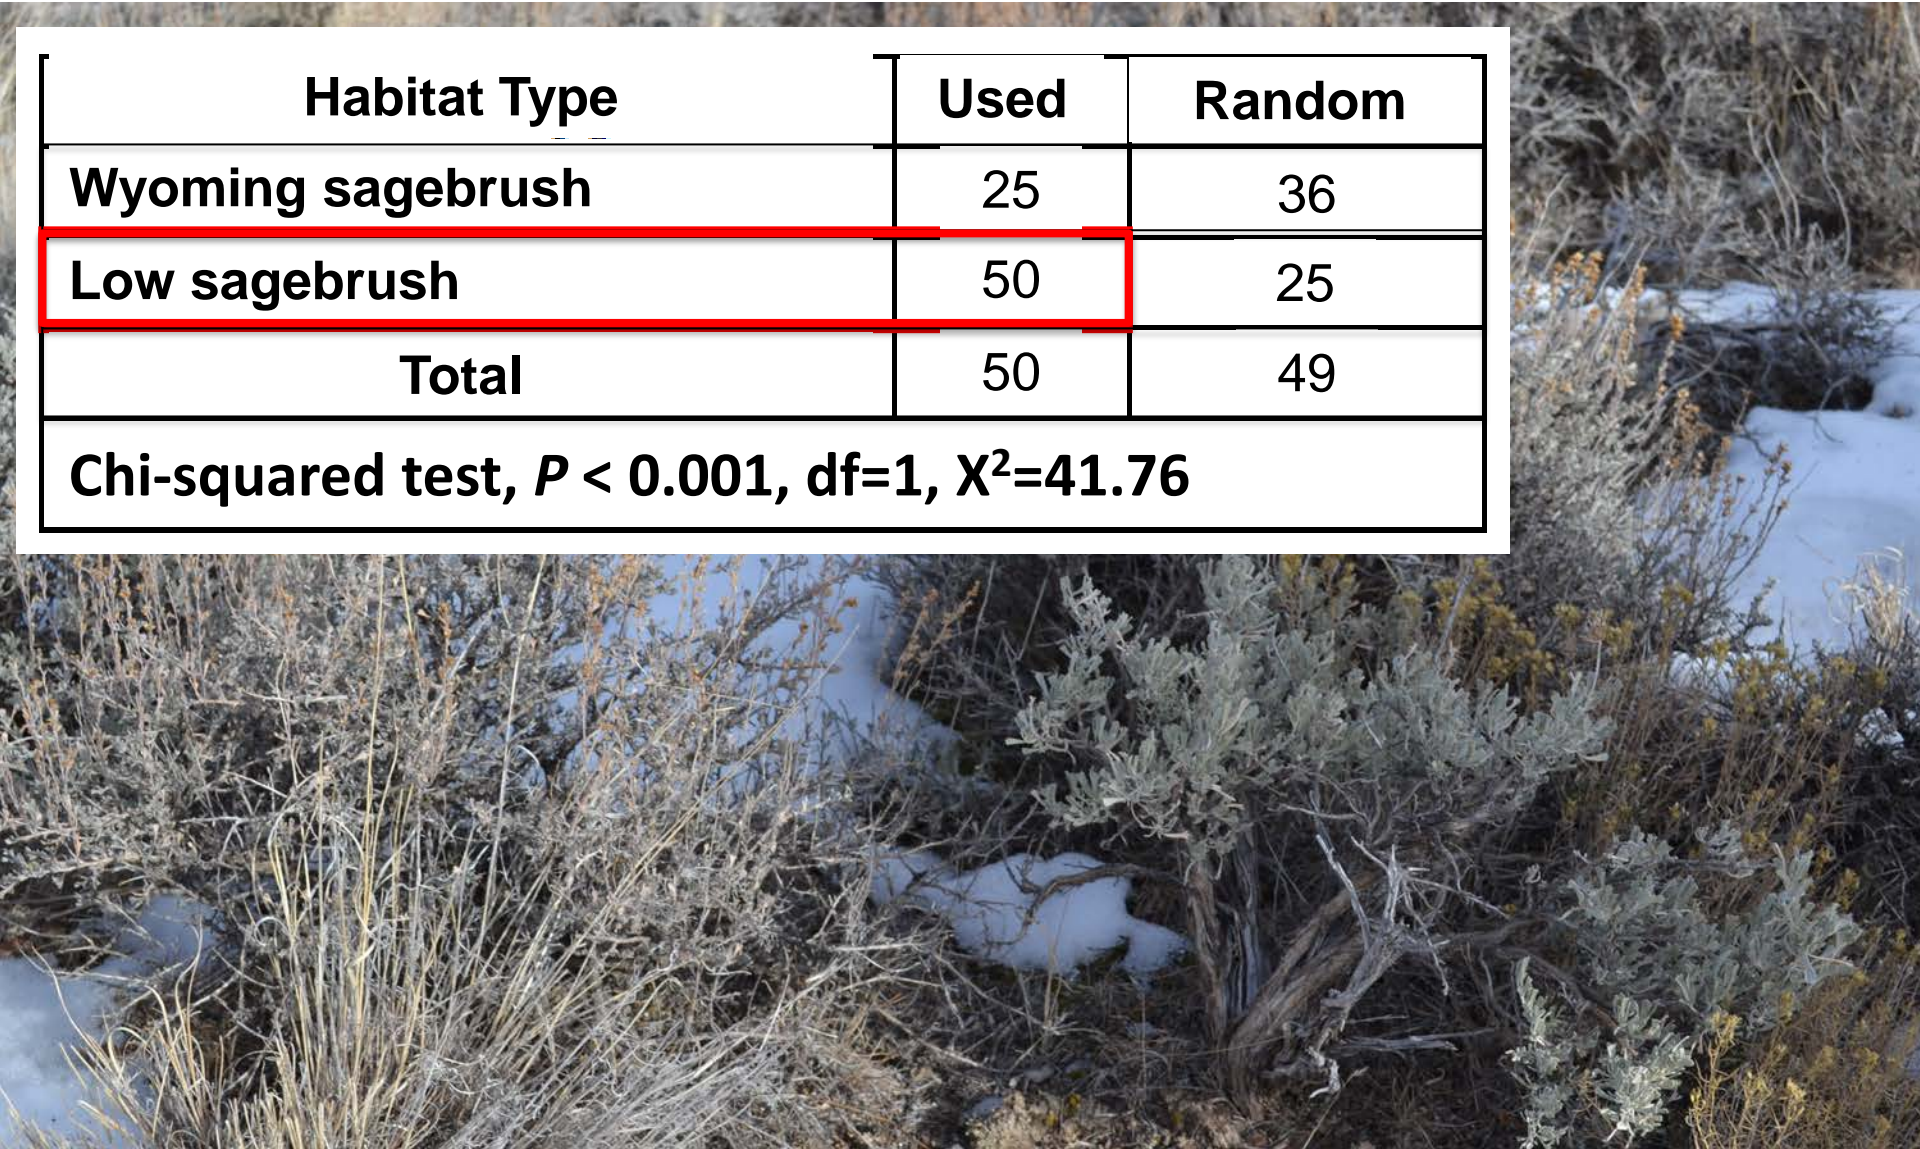

**Black**

# Grouse select habitats with low sagebrush

| Habitat Type      | Used | Random |
|-------------------|------|--------|
| Wyoming sagebrush | 25   | 36     |
| Low sagebrush     | 50   | 25     |
| Total             | 50   | 49     |

Chi-squared test,  $P < 0.001$ ,  $df=1$ ,  $X^2=41.76$

# Selection at the Plant Scale For Protein and Against Toxins

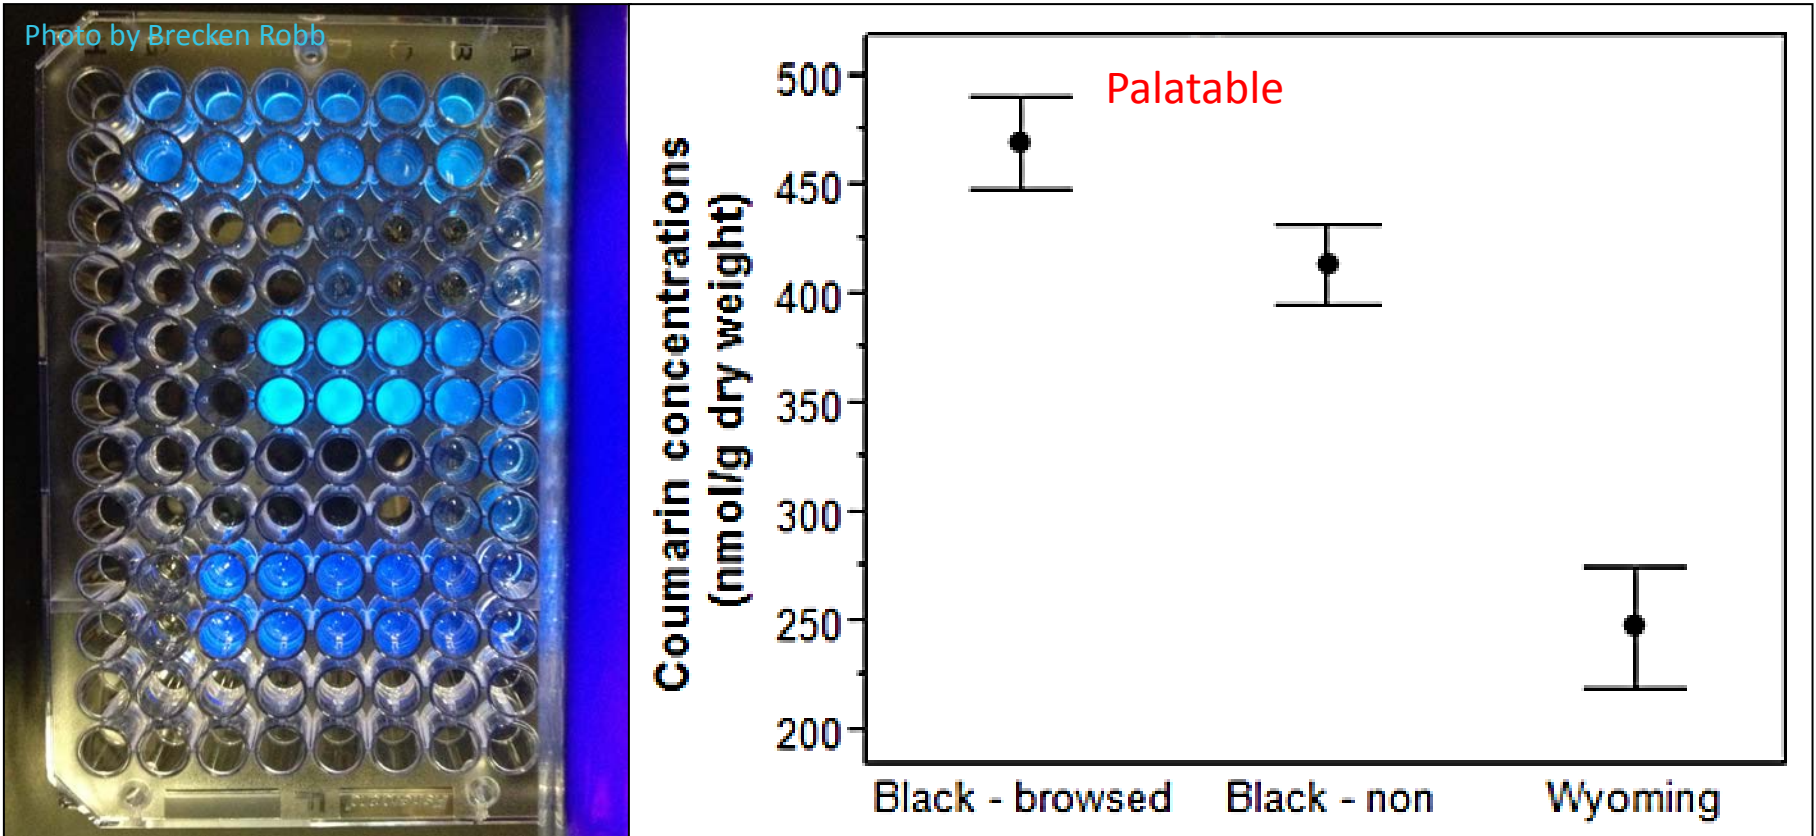

Figure from Frye 2012

Photo by Alan Krakauer

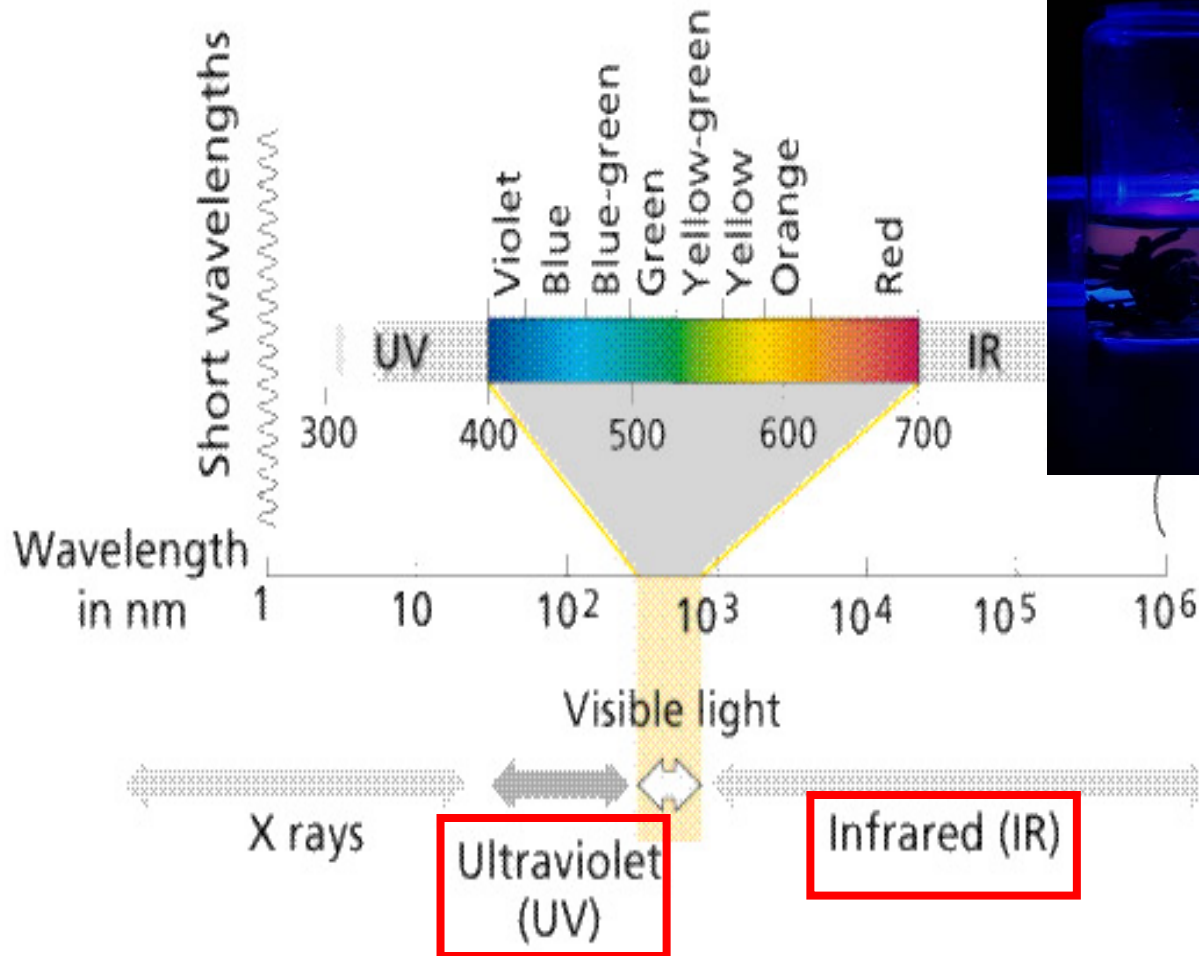

# Sage grouse select for more coumarins

- Coumarins a TYPE of phenolic
- UV fluorescent, used to identify sagebrush species

# How do grouse select coumarins?

- Toxins may reflect light in the Ultraviolet (UV), Near Infrared (NIR) and visible spectrum
- Birds can see in these wavelength

# What factors can change diet quality?

Mowing,  
herbicide  
(Beck- UW, BLM)

Fire history  
(Connelly – IDFG)

Juniper removal  
(U Idaho, Oregon BLM)

Climate change  
(Germino - USGS)

# Impacts of Fire on Diet Quality

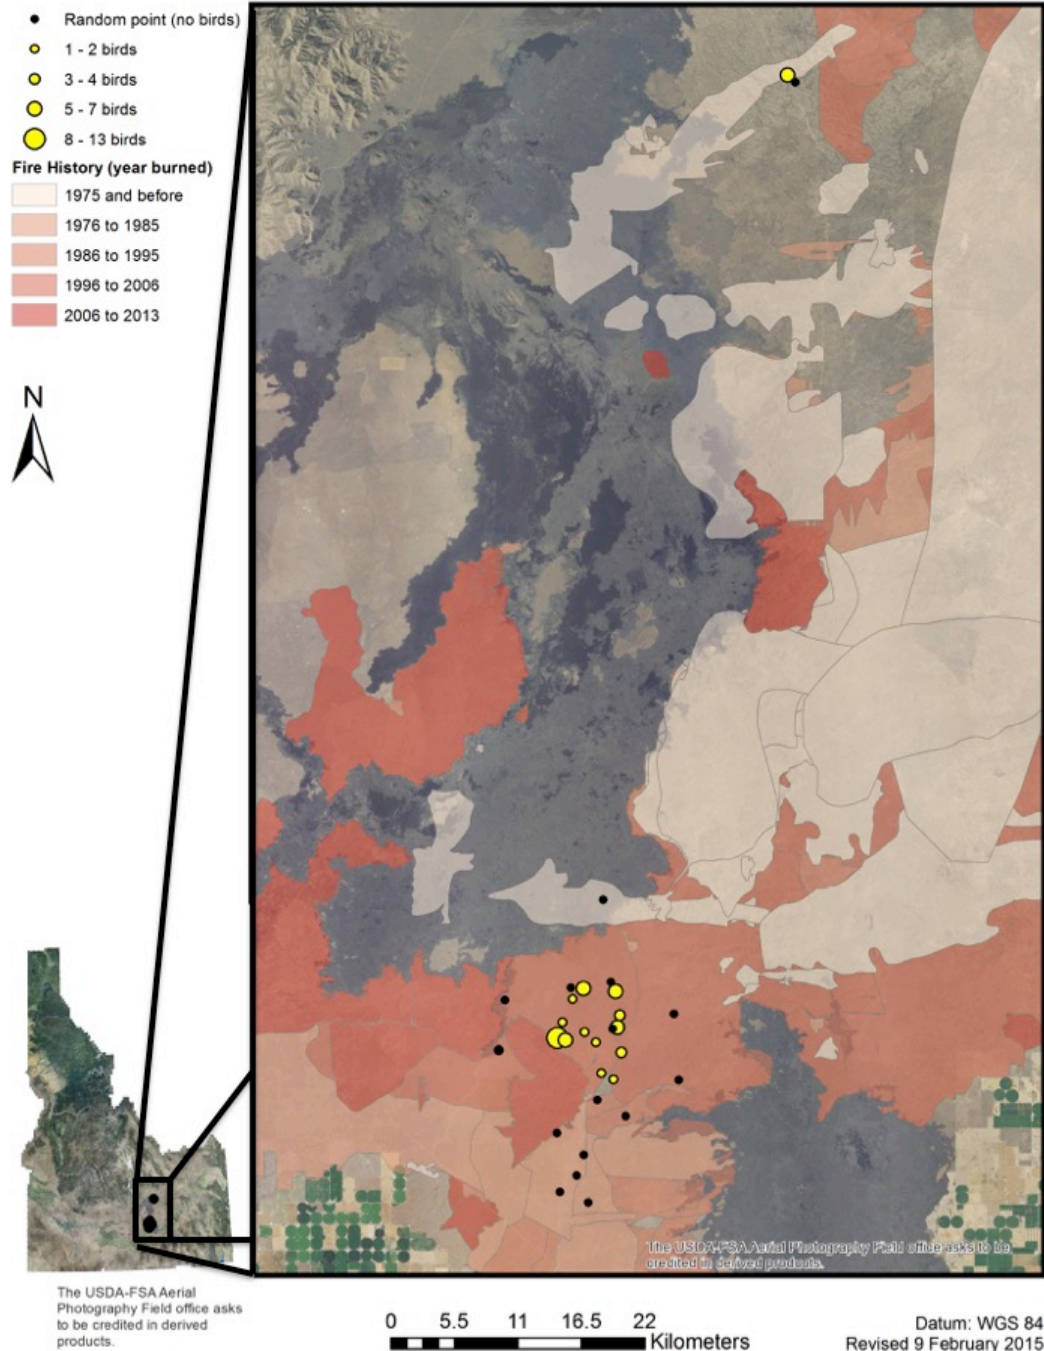

Marcella Fremgen, Dr. John W. Connelly, Dr. Jennifer Forbey (BSU)  
Project underway, anticipated completion in 2015  
South-central Idaho

# Craters Study Site

- Southern end of Craters of the Moon National Monument
- Every used patch has been burned in the last 30 years
- Relatively low flock sizes
- Little sagebrush cover
- Dominant sagebrush species:
  - Wyoming big sagebrush
  - Three-tip sagebrush

# Craters Habitat Use

No  
landscape  
scale  
habitat  
selection

| Habitat Type         | Used         | Random              |
|----------------------|--------------|---------------------|
| Wyoming sagebrush    | 6            | 8                   |
| Three-tip sagebrush  | 3            | 1                   |
| Mixed                | 7            | 7                   |
| <b>Total</b>         | <b>16</b>    | <b>16</b>           |
| Chi-squared analysis | $p = 0.5258$ | $df = 2, U = 0.030$ |

# Craters Protein Analysis

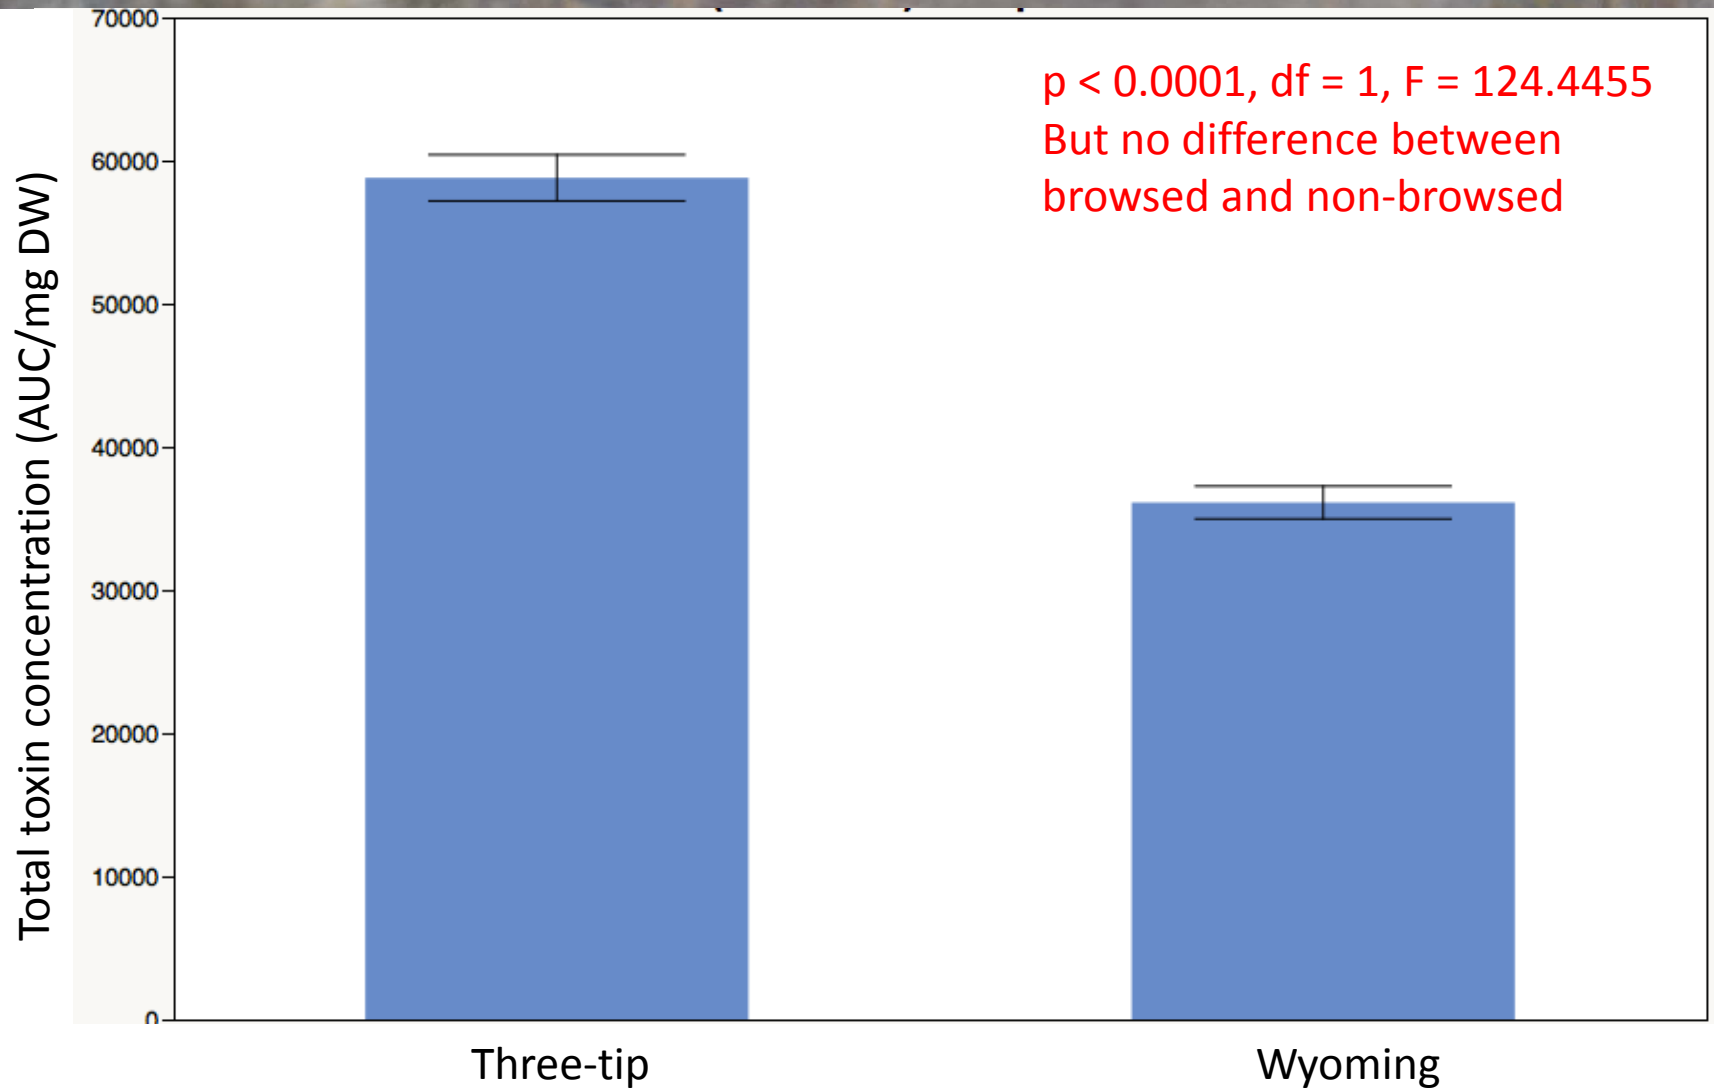

| Species             | Average | Std. Error |
|---------------------|---------|------------|
| Wyoming sagebrush   | 13.303  | 0.3806     |
| Three-tip sagebrush | 10.411  | 0.2619     |

Matched pairs analysis comparing browsed and non-browsed (trends towards higher in browsed):  
Wyoming:  $p = 0.0875$ ,  $df = 1$ ,  $U = -39.500$   
Three-tip:  $p = 0.1250$ ,  $df = 1$ ,  $S = -13.500$

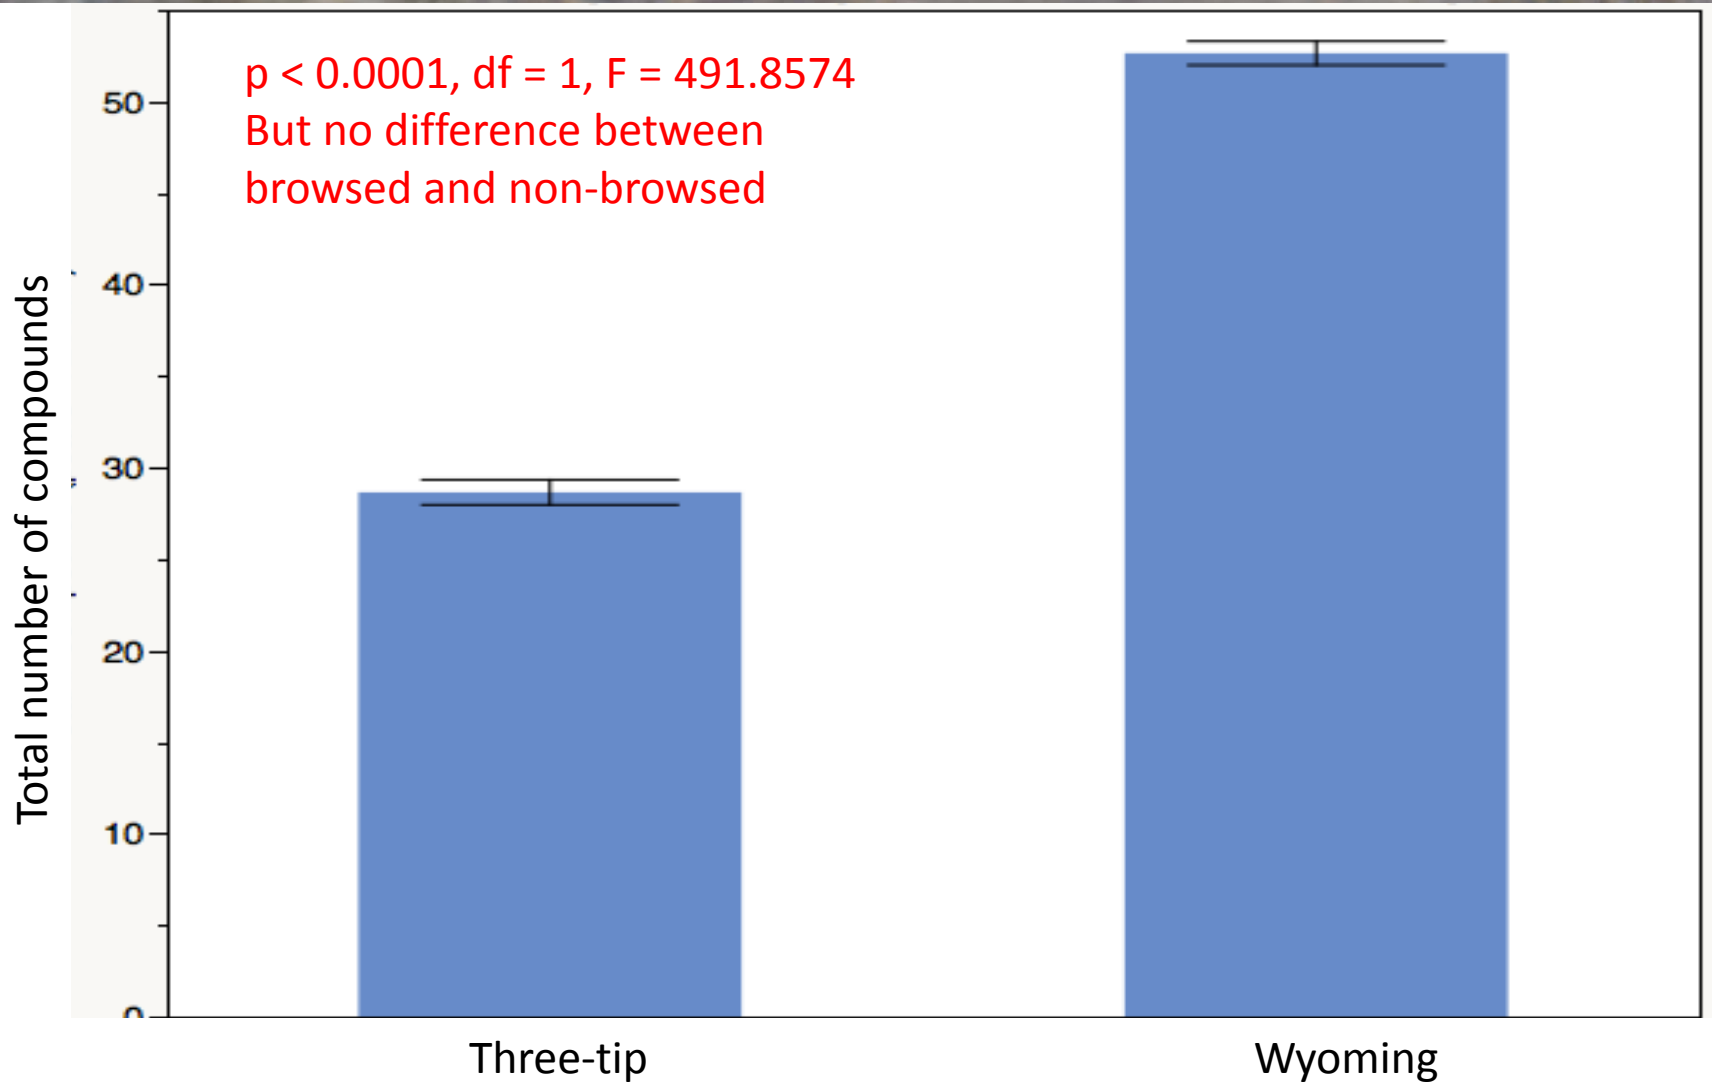

# Craters Toxins

# Craters Toxins

# Species Comparison

## Three-tip sagebrush

- Lower protein
- Higher total AUC
- Lower number of compounds

## Wyoming big sagebrush

- Higher protein
- Lower total AUC
- Higher number of compounds

# Impacts of Fire on Diet Quality

No selection occurred between sagebrush species

May simply not have a choice (overall low food availability)

- Craters: 13% live sagebrush cover
- Brown's Bench: 17.6% live sagebrush cover
- Raft River: 25% live sagebrush cover

Three-tip re-sprouts after fire

May provide food source during restoration efforts

# Mowing and Herbicide Treatments

Dr. Jeff Beck (UW), Dr. Jennifer Forbey (BSU)  
Project underway, anticipated completion in 2015  
Wyoming

# Juniper Removal Treatments

John Severson (UI), Dr. Kerry Reese, Dr. Jennifer Forbey (BSU)  
Project underway, anticipated completion in 2015  
South-central Oregon

Sagebrush out-competed by juniper, restoration efforts underway to re-establish healthy sagebrush

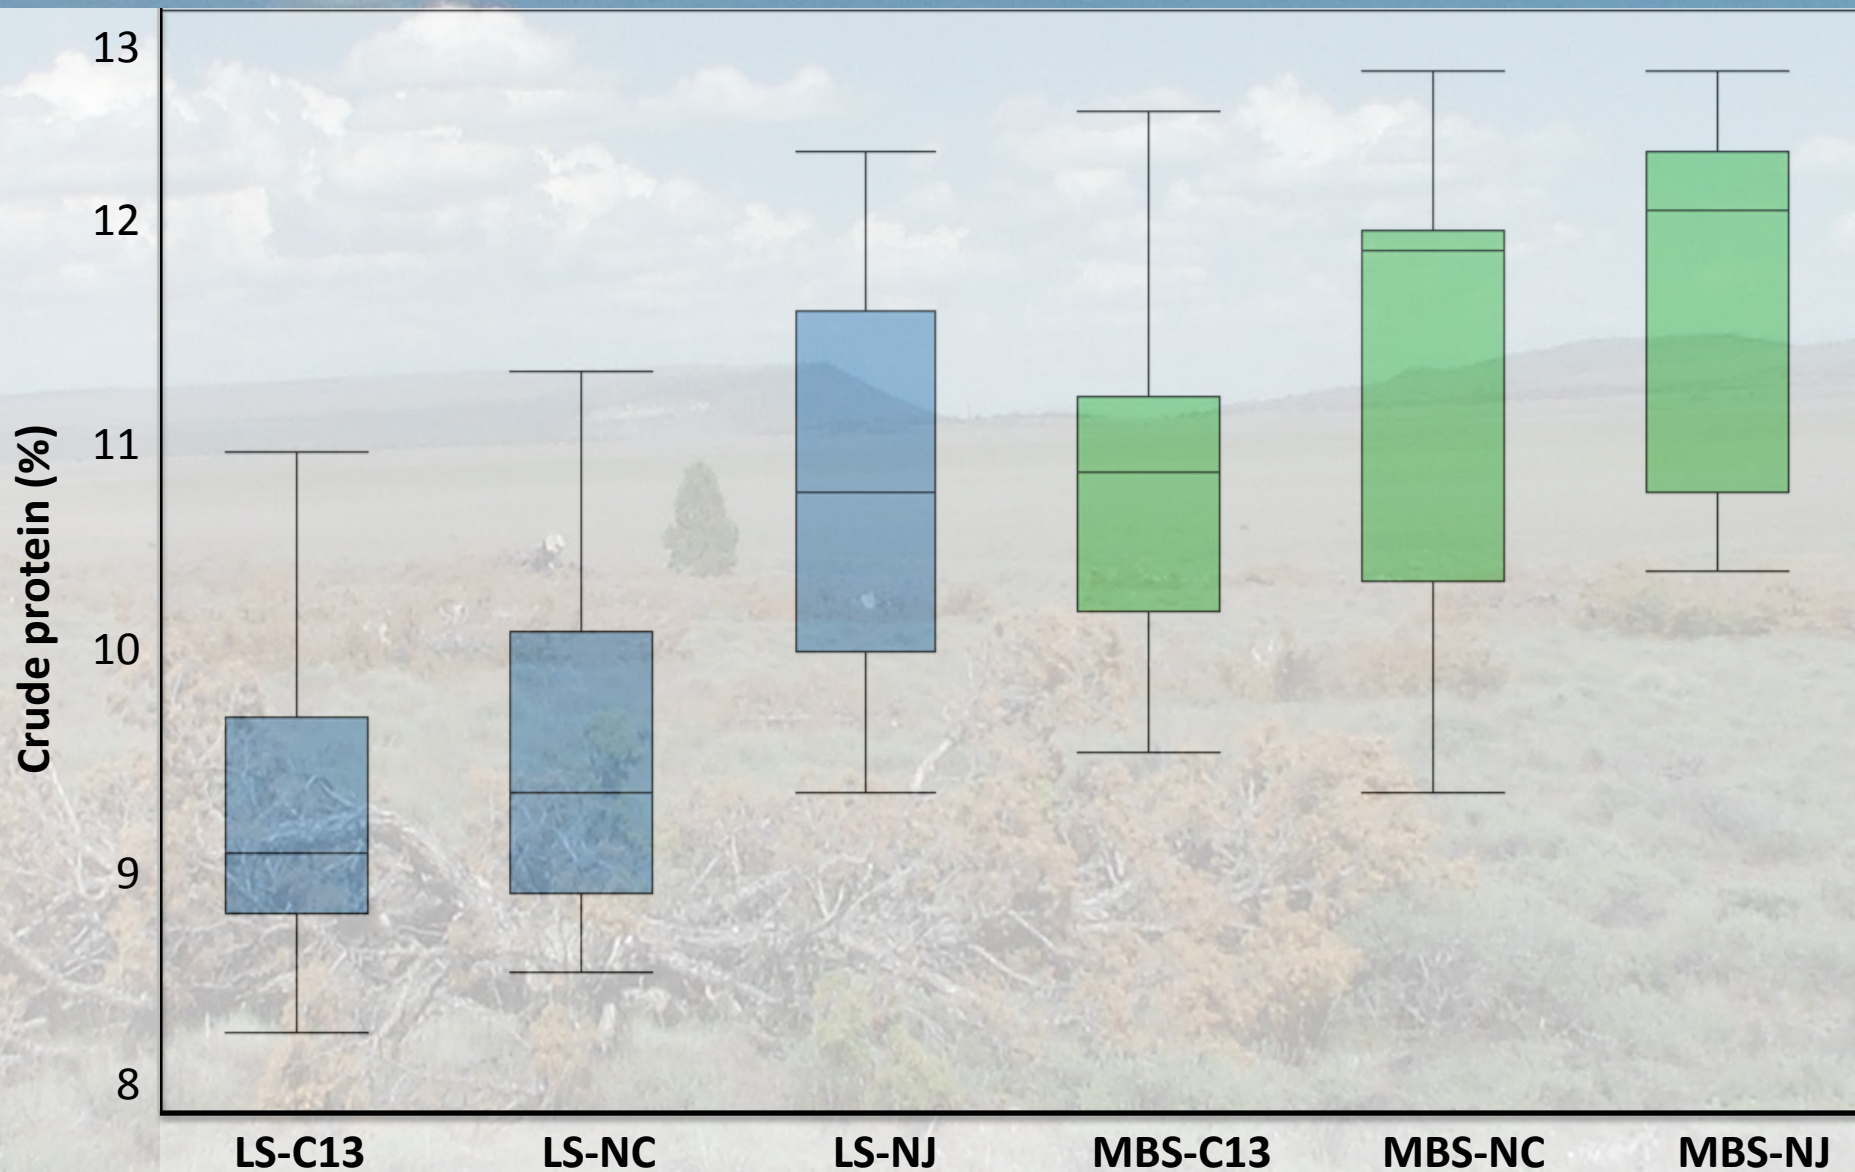

Low sagebrush (above) and Mountain Big Sagebrush (below) at site in Oregon

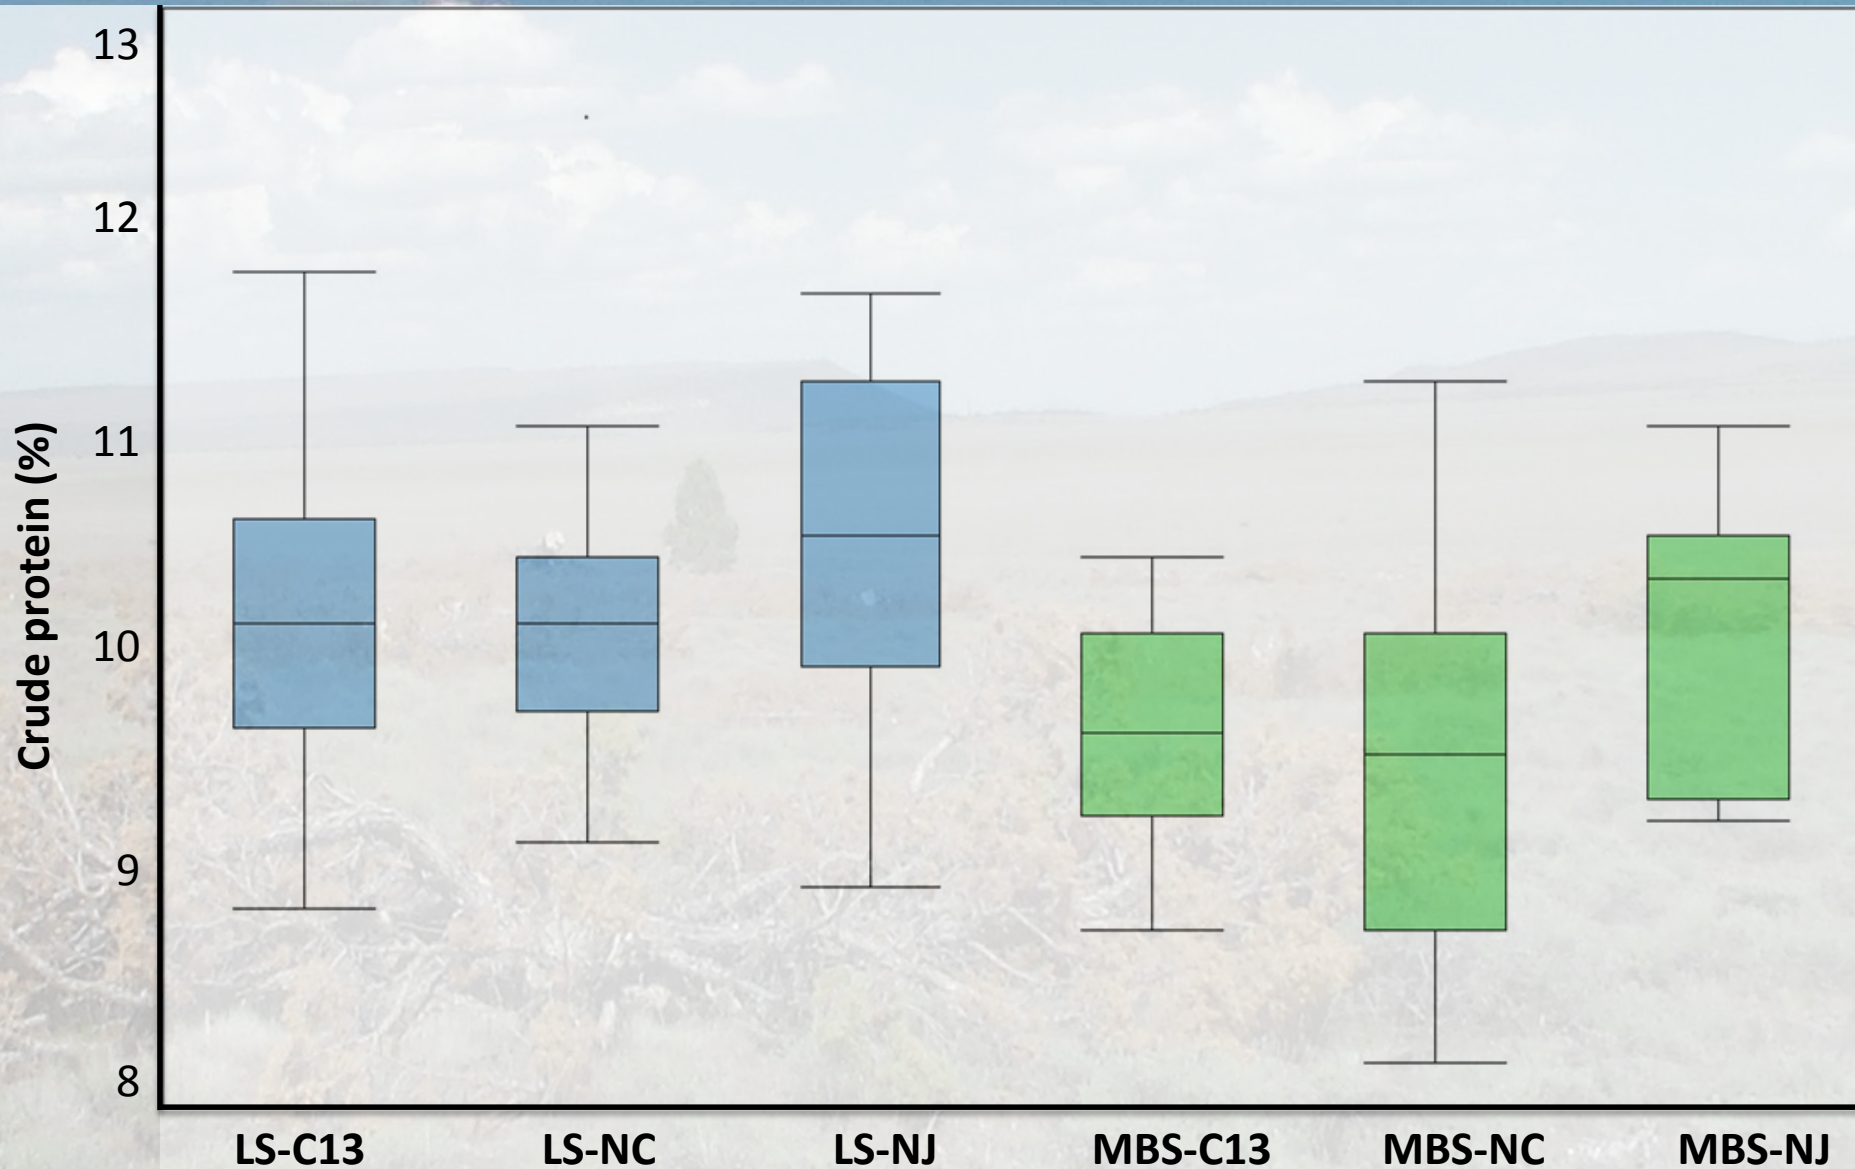

# Pre-treatment (2013) Crude Protein

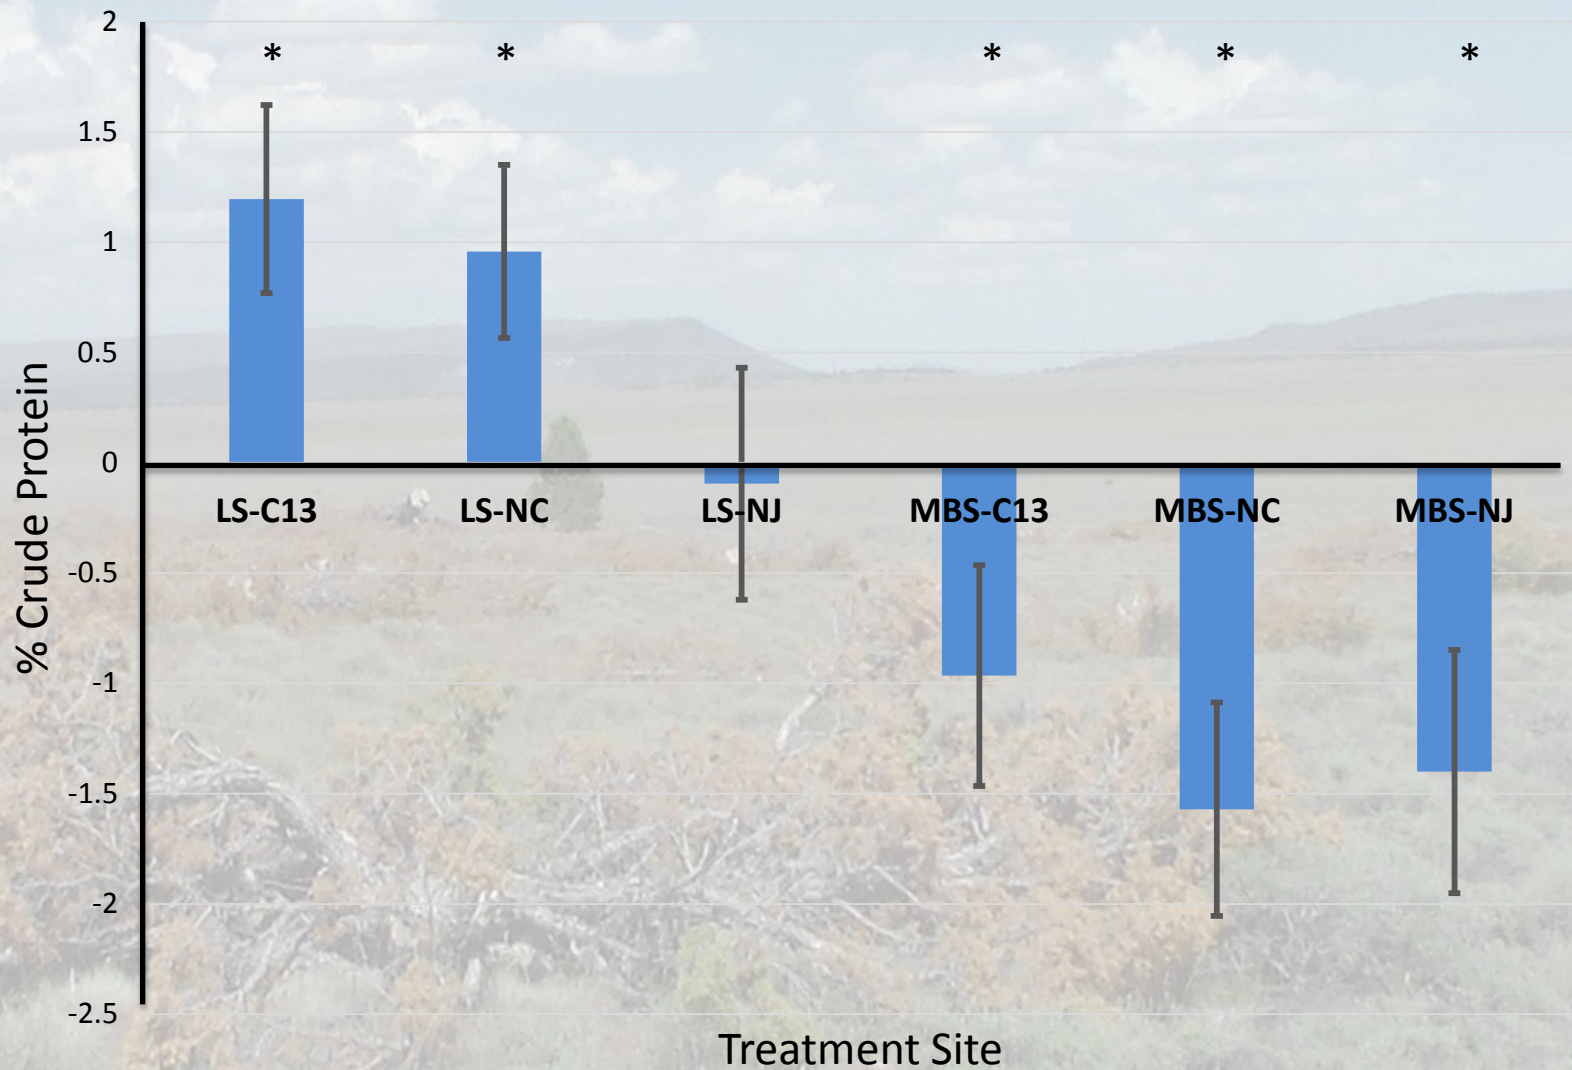

# Post-treatment (2014) Crude Protein

# Average Protein Difference Between 2013 and 2014 at Treatment Sites

# Juniper Treatment Effects on Protein

- Complex, may take more long-term monitoring
- Current monitoring: no treatment effect
  - BUT annual variation in protein content
- Species specific variation
- Other chemical analysis (phenolics, monoterpenes) pending

Photos by Karli Graski and Kayla Luke

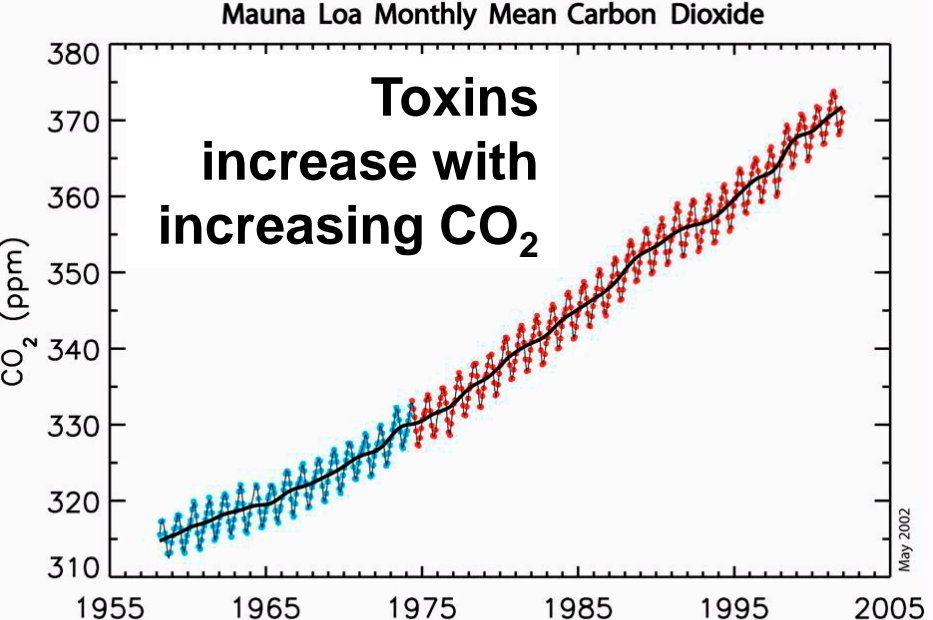

Juniper treatment- pile and burn, hand-cut

# Impacts of Extensive Treatments?

# Risks of toxins are predicted to increase with climate change

**Lower tolerance to toxins with increased temperatures**

# Diversity and Climate Change

- Chemical diversity may provide some resilience
- Allow herbivores to select best food as food quality and physiology change

# If Diet Quality Matters, How Do We Monitor and Manage It?

Remotely sensed forest, mapping chemical components of the forest

Monitor visual cues  
at larger spatial  
scales: Hyperspectral  
imagery for “food-  
scapes”

Chemical composition of tropical forest  
<http://spectranomics.stanford.edu/>

# Application of monitoring food quality in conservation

# Summary: Diet Quality Is Important!

Diet quality impacts habitat use, reproduction and movement in some species

Certain types of habitat restoration may influence diet quality – need to understand for proper management

Questions?

# Conservation Status and Habitat Quality Implications

Photo by Geneva W. Chong

**Sage-grouse Range**  
● Current Range  
● Historical Range

0 125 250 500 750 1,000 Kilometers

Map by Center for Native Ecosystems, Washington Department of Fish and Wildlife, M. Schroeder

# Selective Foraging

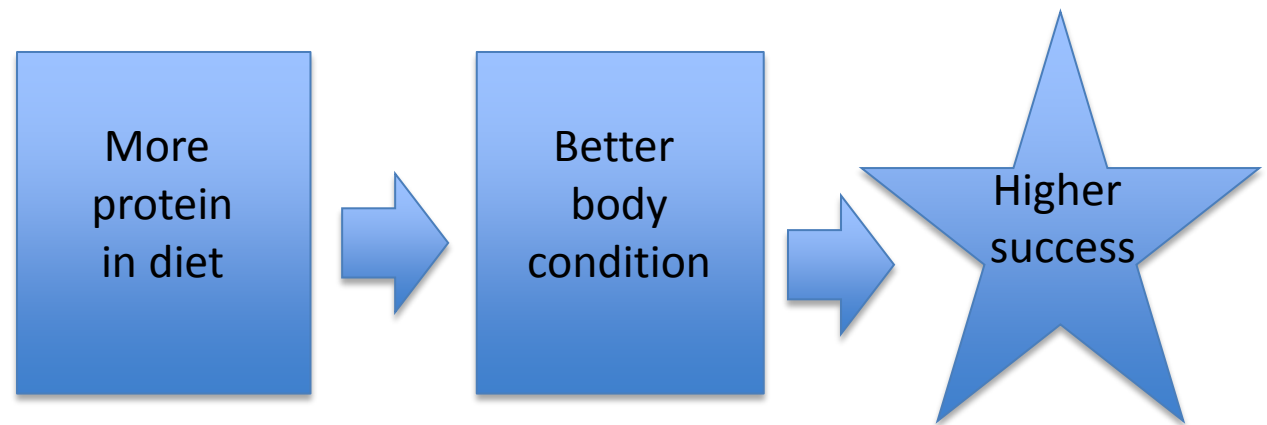

## Patch Selection

# Diet quality (especially protein) impacts reproduction

Most commonly studied in females

# Diet Quality Impacts Reproduction

Photo by Tony Palliser

Blue petrels

- Low foraging success means an individual is not able to invest in reproduction that season

# Diet Quality Impacts Reproduction

Photo by Carol Hermesh

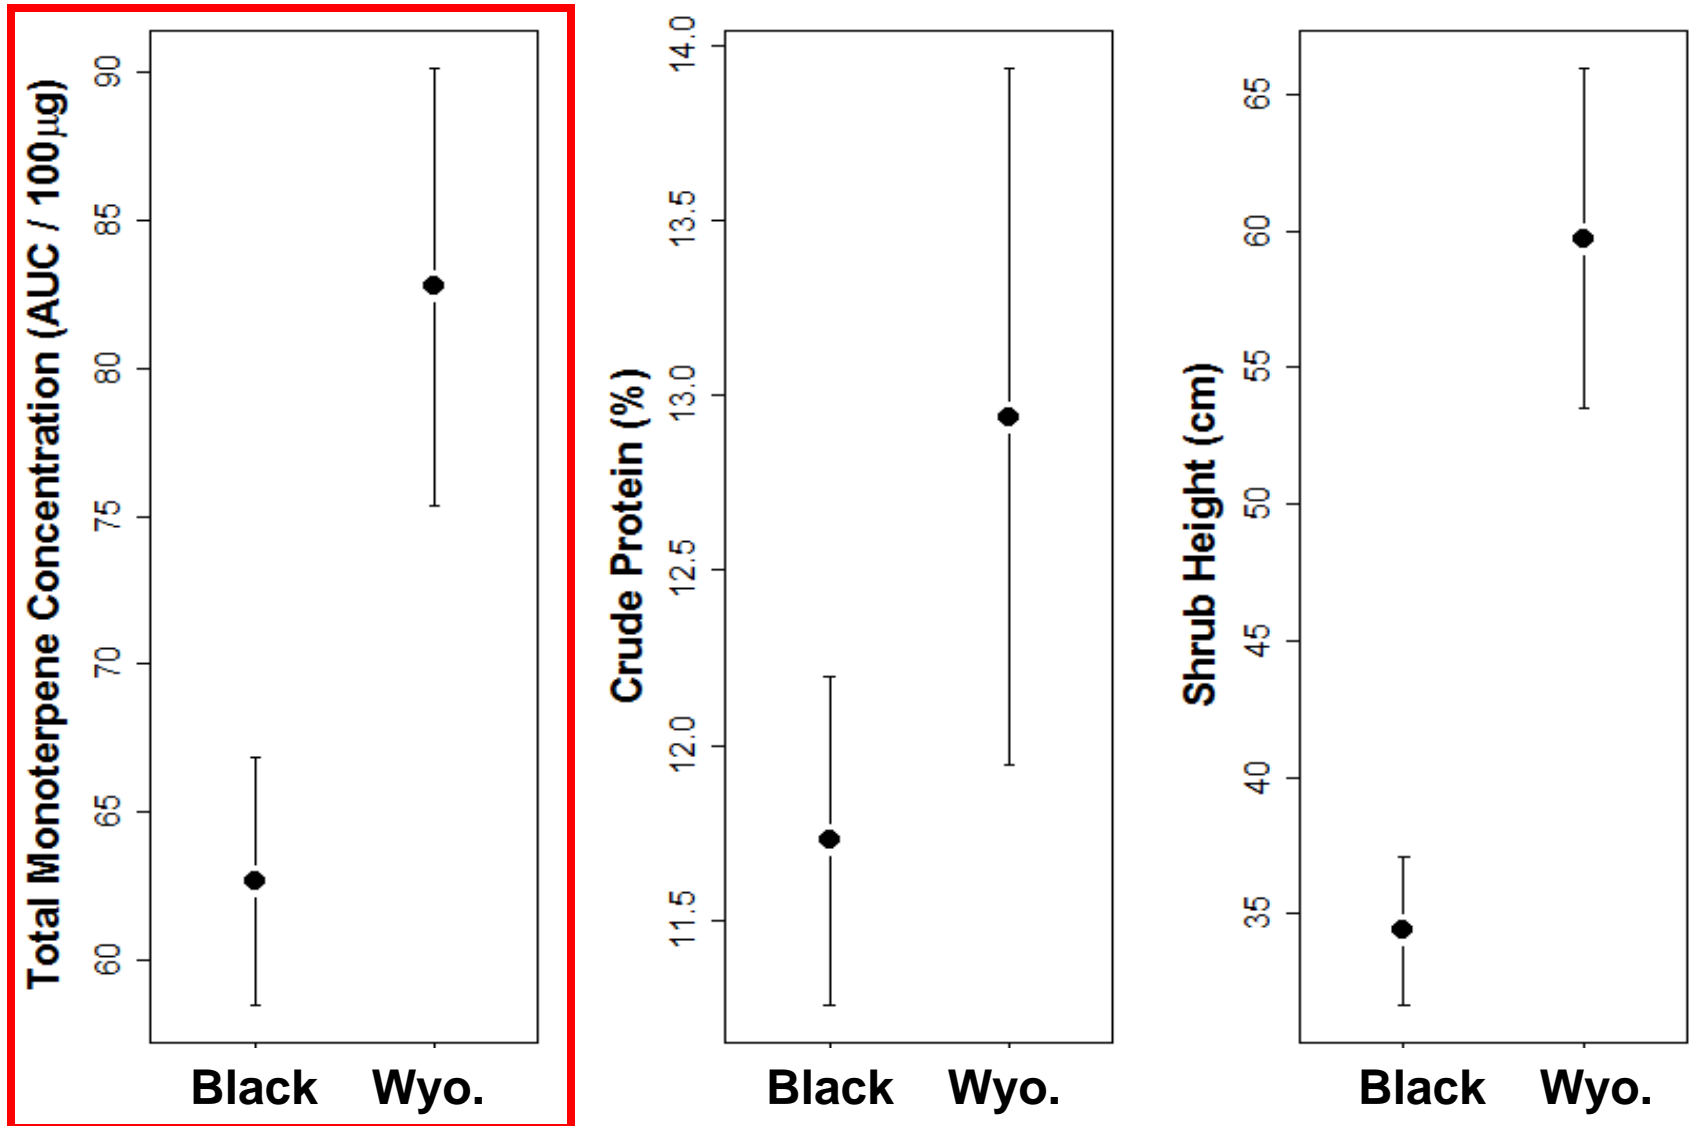

Field Crickets

- Males with more protein in diet able to maintain higher display rates and attract more females

# Habitat Scale: Sage-grouse selected patches with black sagebrush to avoid toxins

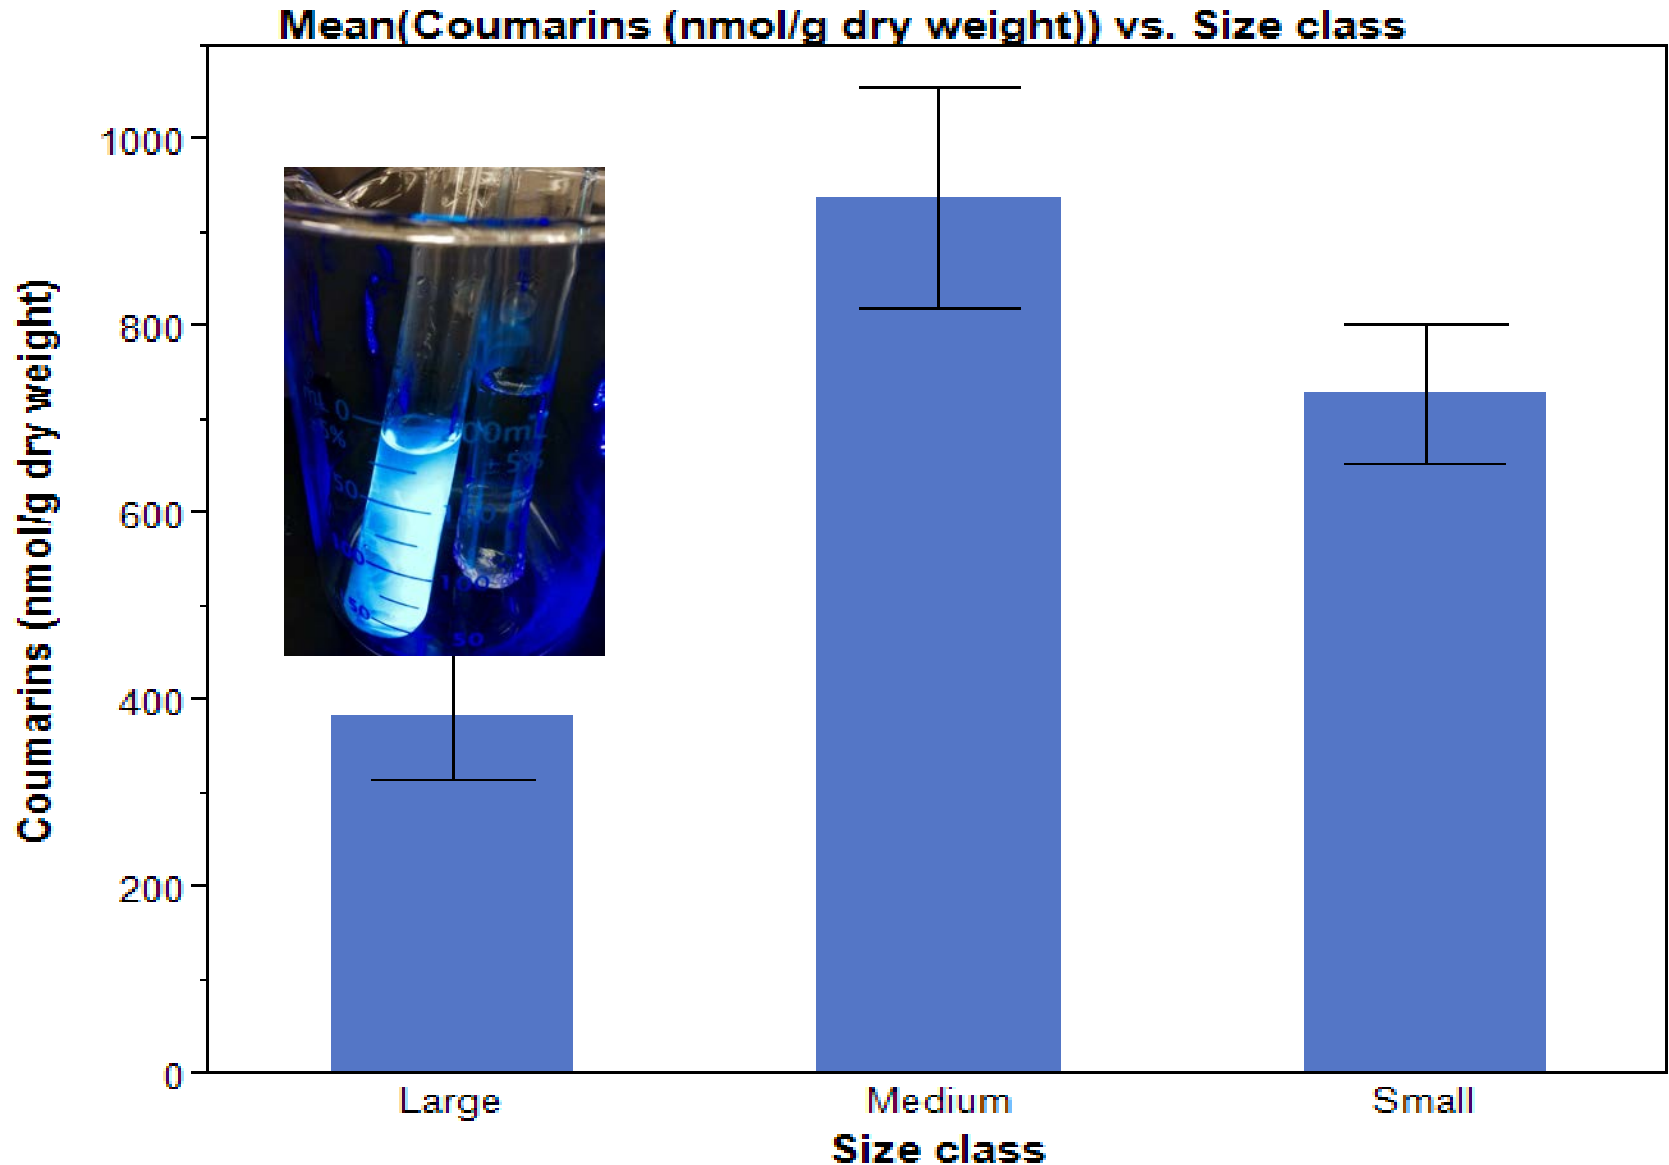

Objective 1:  
Structural  
diversity reflects  
chemical  
diversity  
(monoterpenes)

# Objective 1: Structural diversity reflects chemical diversity (coumarins)

# Results at Raft River: chemical diversity within patches (coumarins)

Mean(Coumarins (nmol/g dry weight)) vs. Species

Coumarins

$F_{11} = 4.15, p = 0.07$

*A. Arbuscula*

*A. t. wyomingensis*

# Objective 3: Sage grouse select for high patch diversity

# Monitor visual cues: quantify toxins in sagebrush using Near Infrared sensors
